

ATPESC Track 4: Scalable Molecular Visualization and Analysis Tools in VMD

John E. Stone

Theoretical and Computational Biophysics Group
Beckman Institute for Advanced Science and Technology
University of Illinois at Urbana-Champaign

<http://www.ks.uiuc.edu/Research/vmd/>

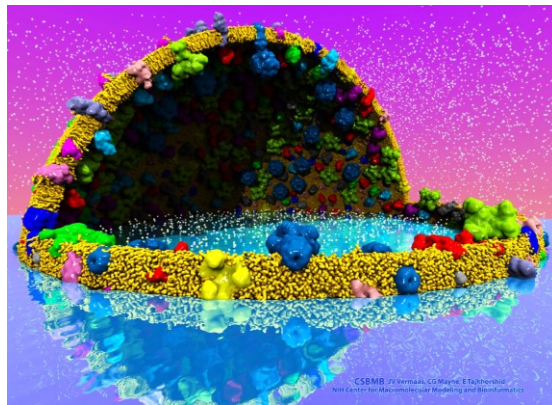

Argonne Training Program on Exascale Computing (ATPESC)

10:15am-11:00pm,

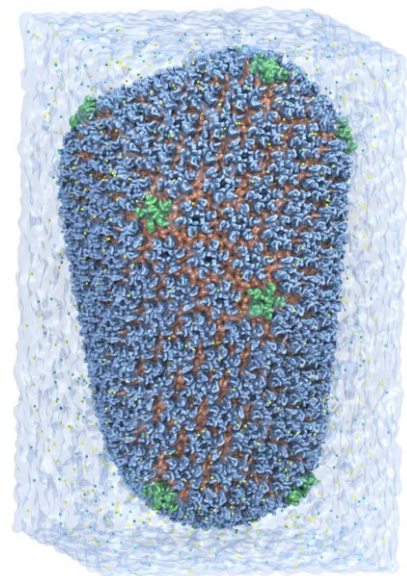

Monday August 9th, 2021

VMD – “Visual Molecular Dynamics”

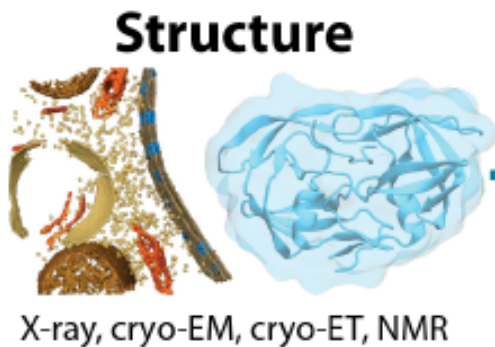

- 100,000 active users worldwide
- Visualization and analysis of:
 - Molecular dynamics simulations
 - Lattice cell simulations
 - Quantum chemistry calculations
 - Cryo-EM densities, volumetric data
- User extensible scripting and plugins
- <http://www.ks.uiuc.edu/Research/vmd/>

Cell-Scale Modeling

MD Simulation

Parameterization

Analysis

VMD Hands-On Tutorials

- <http://www.ks.uiuc.edu/Training/Tutorials/#vmd>
 - Main VMD tutorial
 - QwikMD simulation preparation and analysis plugin
 - VMD images and movies tutorial
 - Structure check
 - VMD quantum chemistry visualization tutorial
 - Visualization and analysis of CPMD data with VMD
 - Parameterizing small molecules using ffTK

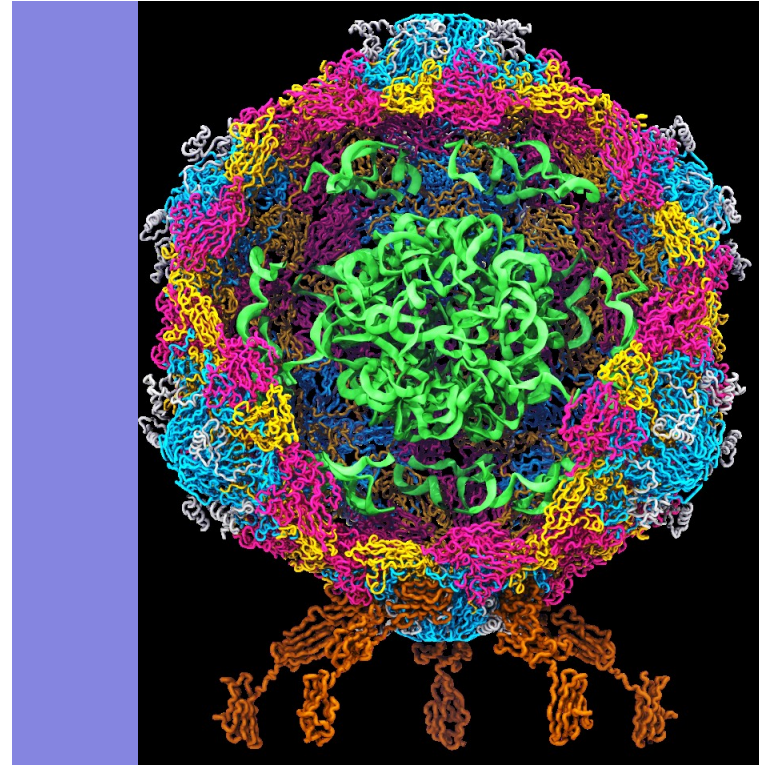

Goal: A Computational Microscope

Study the molecular machines in living cells

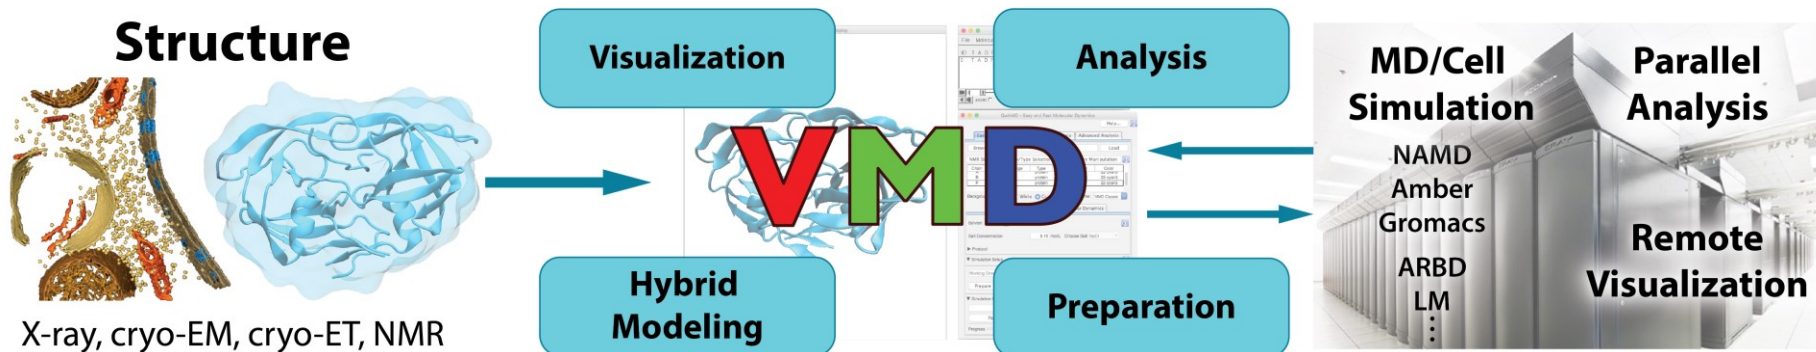

Ribosome: target for antibiotics

Poliovirus

VMD: Building A Next Generation Modeling Platform

- Provide tools for simulation preparation, visualization, and analysis
 - Reach cell-scale modeling w/ all-atom MD, coarse grained, Lattice Microbes
 - Improved performance, visual fidelity, exploit advanced technologies (GPUs, VR HMDs)
- Enable hybrid modeling and computational electron microscopy
 - Load, filter, process, interpret, visualize multi-modal structural information
- Connect key software tools to enable state-of-the-art simulations
 - Support new data types, file formats, software interfaces
- Openness, extensibility, and interoperability are VMD hallmarks
 - Reusable algorithms made available in NAMD, for other tools

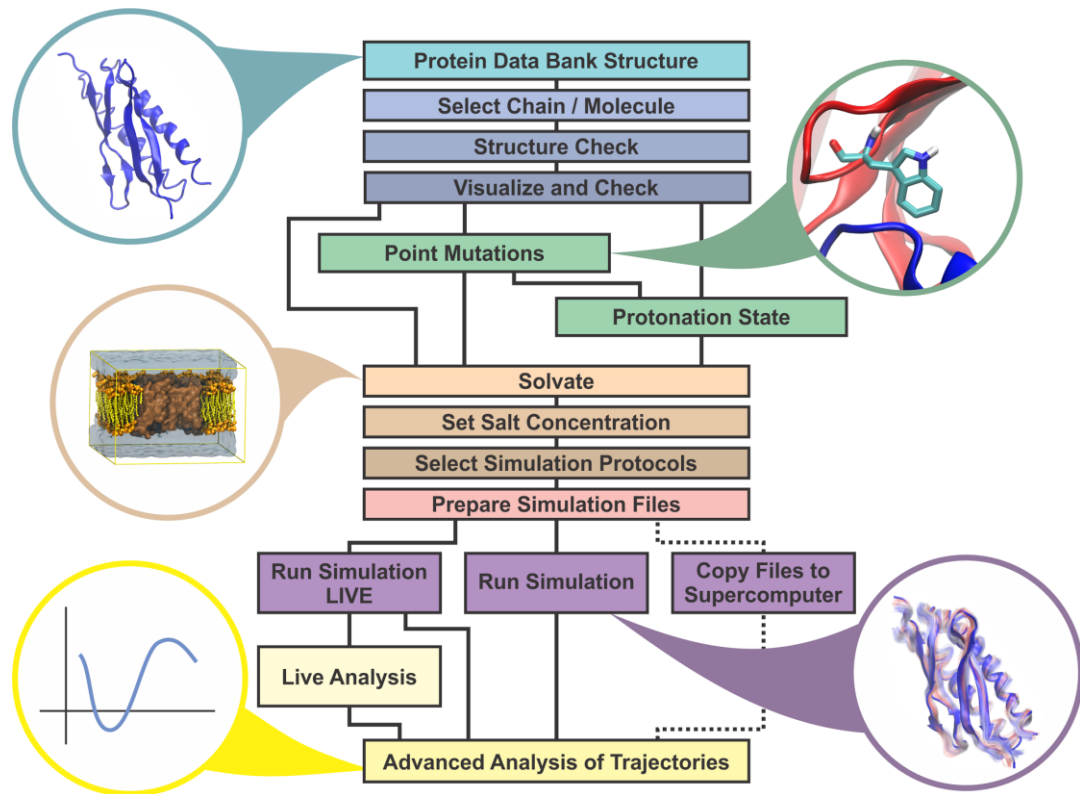

QwikMD: Guided MD Simulation and Training

Smooths initial learning curve (non-expert users)

Speed up tedious simulation preparation tasks (expert users)

Reproducibility:
detailed log of all steps

Interactive preparation, simulation, and analysis

Selected VMD Plugins: Center Developed, and User Developed

VMD Visualization Concepts

VMD Approach to Visualization

- Molecular scene is composed of “graphical representations”
- Each representation encapsulates a group of selected atoms, a drawing style, coloring style, and other parameters
- Representations are independent of each other, can be toggled on/off easily, allowing molecular scenes to be built-up incrementally
- VMD atom selection language is shared with its analytical and scripting interfaces

Selection, Filtering

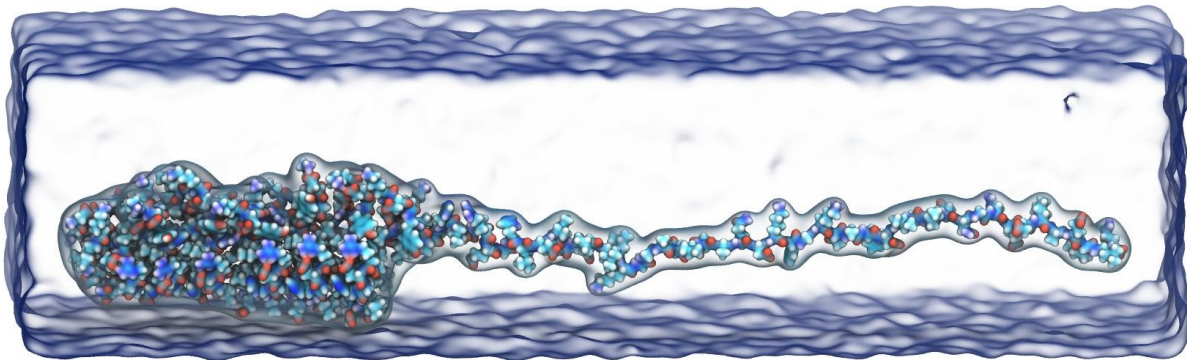

- Most viz tools allow interactive visual picking, menu-driven selections of structure components to display or operate on
- VMD also extensively uses a text-based selection language (think google):
 - water within 10 of protein and $z > 0$
 - nucleic or protein or ions
 - segname BR
 - name "C.*"
- Allows selection on user-defined data fields
- ***Promotes synergy between interactive and scripting interfaces, visualization and quantitative analysis tasks***
- Works well with huge time-varying structures

Structure Visualization

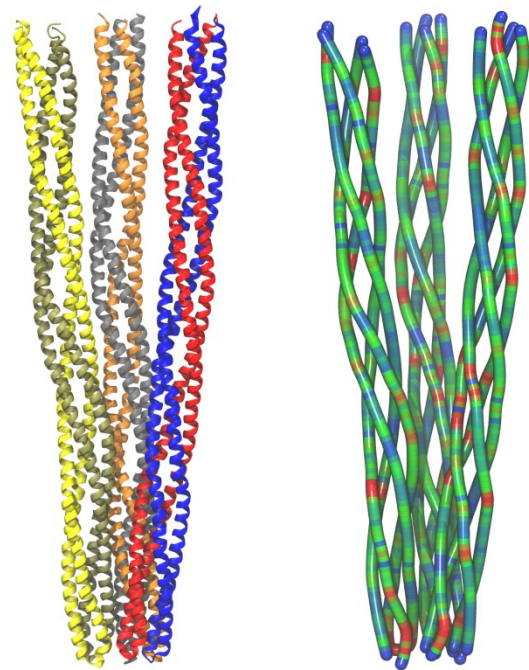

Molecular representations provide different levels of abstraction, atomic detail vs. higher level organizational information

- Atoms, VdW spheres, bonds, ball-stick, ...
- Coarse-grained “beads”
- Ribbons, secondary structure, “cartoon” reps, RNA/DNA
- Molecular surfaces
- Molecular orbitals (quantum chemistry)

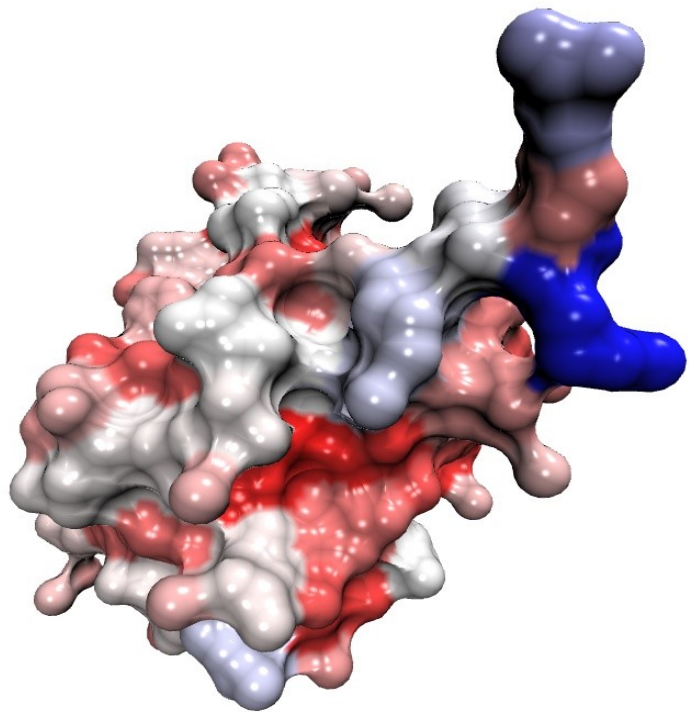

Computed Properties

- Smoothing of thermal noise
- Secondary structure
- Hydrogen bonds, salt bridges
- Forces, energies, stress, strain
- Time averaging of electrostatic fields, occupancy maps
- Quality-of-fit cross correlation with cryo-EM density maps
- Normal modes, principal component analysis, essential dynamics
- Cluster simulation trajectory timesteps by structural similarity

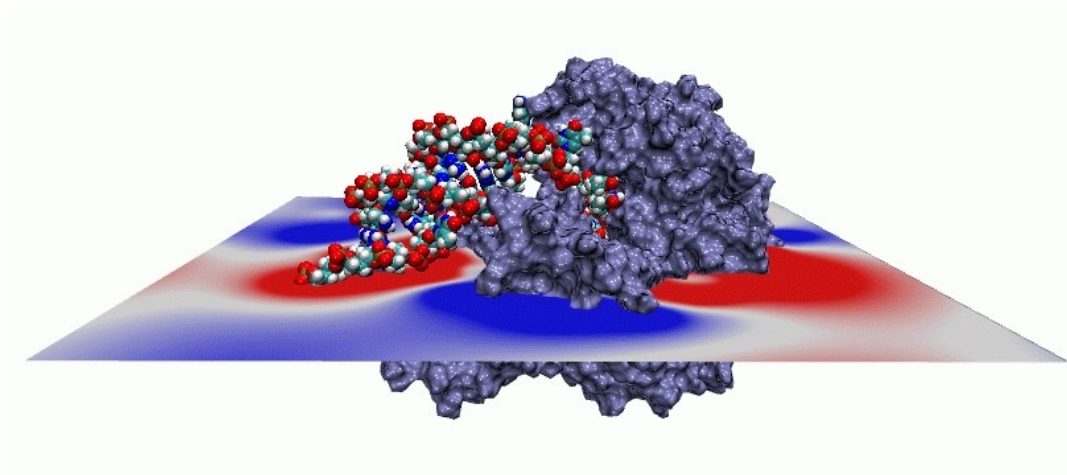

Chemoreceptor trimer-of-dimers analysis with Bendix plugin in VMD

Display of Computed Properties on Structures

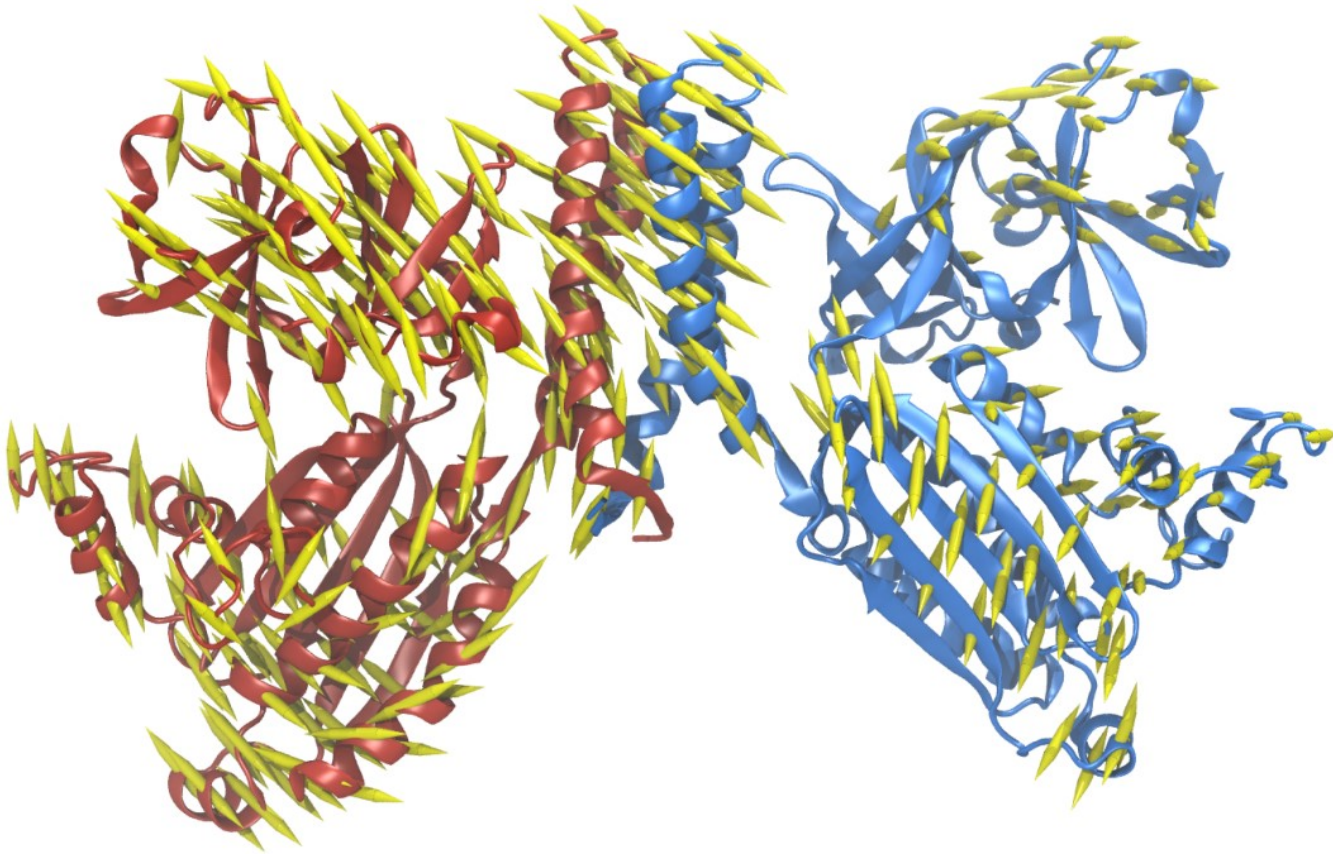

**Per-residue solvent-accessible
surface area of Ubiquitin**

Shadowing

Trajectory Analysis and Visualization

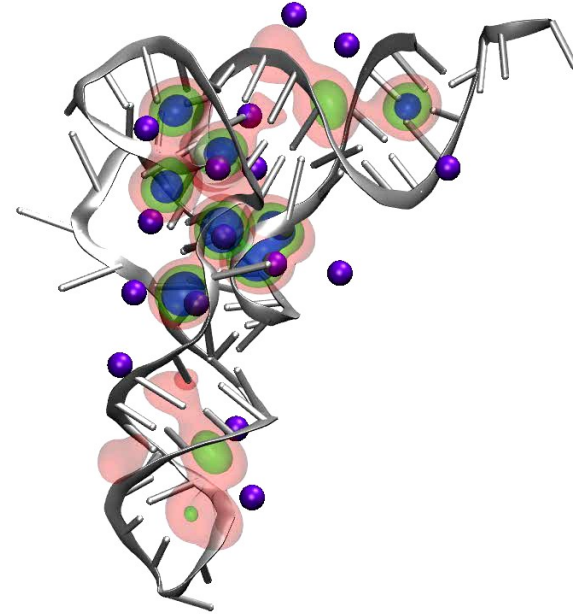

Visualization of MD Trajectories

- Allow researchers study trajectories by analyzing force profiles, energies, structural changes, etc.
- **Visualization selections, graphics, structure properties, colors can all be recomputed for each trajectory timestep!**

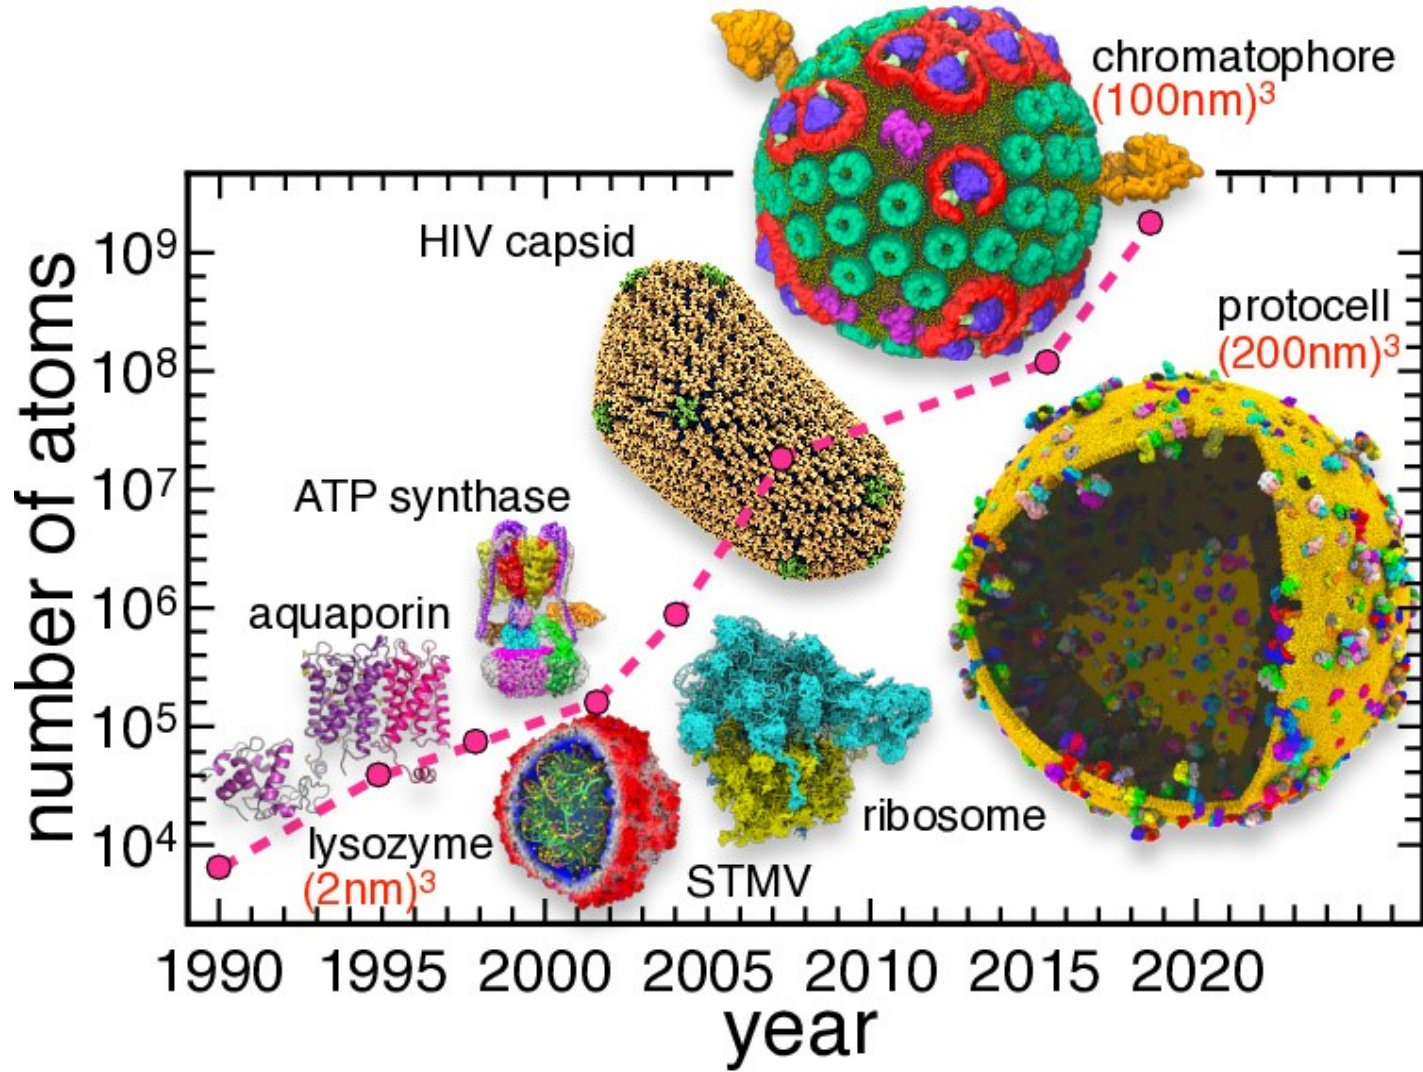

Time-Averaged Volumetric Properties

- Compute density, distance, occupancy, potential maps for a frame or averaged over a trajectory
- Example: display binding sites for diffusively bound ions as probability density isosurfaces

**tRNA magnesium ion occupancy:
VMD volmap plugin**

Large System Analysis and Visualization

VMD Petascale Visualization and Analysis

- Combination of growing system sizes and timescales of simulation trajectories poses a major data size challenge for molecular visualization and analysis
- Parallel I/O rates up to **275 GB/sec** on 8192 Cray XE6 nodes – can read in **231 TB in 15 minutes!**
- Analyze/visualize large trajectories **too large to transfer off-site:**
 - User-defined parallel analysis operations, data types
 - Parallel rendering, movie making
- Supports GPU-accelerated compute nodes for both visualization and analysis tasks:
 - GPU accelerated trajectory analysis w/ CUDA
 - OpenGL and GPU ray tracing for visualization and movie rendering

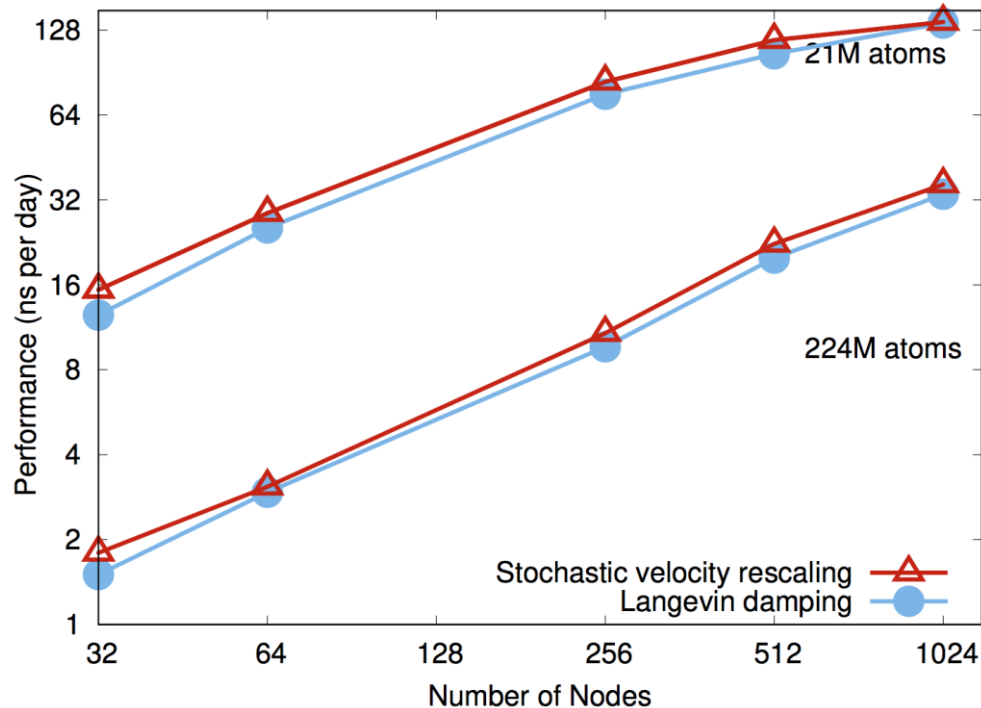

NCSA Blue Waters Hybrid Cray XE6 / XK7
22,640 XE6 dual-Opteron CPU nodes
4,224 XK7 nodes w/ Tesla K20X GPUs

Parallel VMD currently available on:
ORNL Summit and Titan, NCSA Blue
Waters, IU Big Red II, CSCS Piz Daint,
many similar systems

Petascale Molecular Dynamics I/O and Storage Challenges

- NAMD simulations can produce up to **10TB/day @ 1024 nodes (~20%) of ORNL Summit**, more as optimizations raise NAMD performance further
- Petascale science campaigns require **months of simulation runs**
- **Long-term storage of large-fractional petabytes impractical**
- **Historical “download output files for analysis and visualization” approach is a non-starter at this scale**
- Demands visualization and analysis operate on the data **in-place** on the HPC system, **whether *post-hoc*, *in-transit*, or *in-situ***
- Analyses must **identify salient features of structure, dynamics**, cull data that don't contribute to biomolecular processes of interest

NAMD on Summit, May 2018

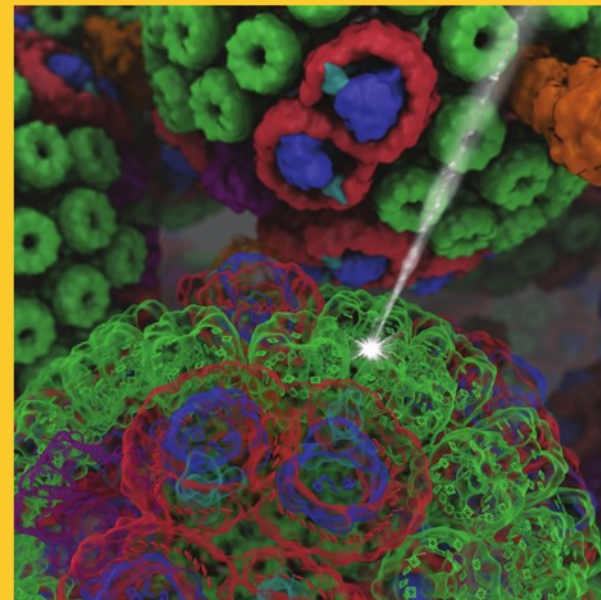

NAMD simulations can generate up to 10TB of output per day on 20% of Summit

Proto-Cell Data Challenges

- 1B-atom proto-cell requires nodes with more than TB RAM to build complete model...
- 1B-atom proto-cell binary structure file: 63GB
- Trajectory frame atomic coordinates: 12GB, 1.2TB/ns of simulation (1 frame per 10ps)
- Routine modeling and visualization tasks are a big challenge at this scale
 - **Models contain thousands of atomic-detail components** that must work together in harmony
 - **Exploit persistent memory technologies** to enable “instant on” operation on massive cell-scale models – eliminate several minutes of startup during analysis/visualization of known structure
 - **Sparse output of results at multiple timescales** will help ameliorate visualization and analysis I/O
 - **Data quantization, compression, APIs like ZFP**

Running VMD on Distributed Memory Clouds, Clusters, and Supercomputers with MPI

Using VMD MPI Builds

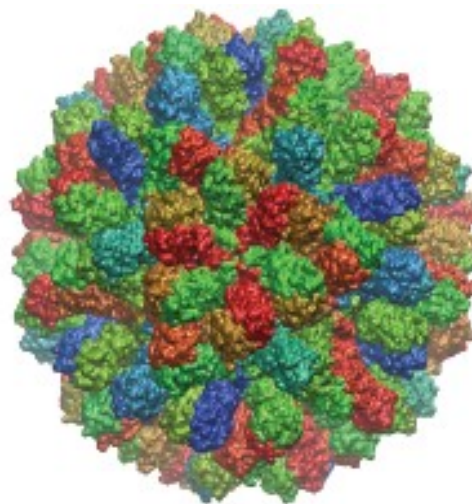

- **See “Running VMD on Supercomputers” section in the VMD tutorial**
- Run one MPI rank (VMD process) per compute node
 - Each rank uses all CPU cores and all GPU accelerators they find
 - GPUs are shared between graphics/visualization and computing tasks
- Parallel VMD Scripting APIs:
 - “parallel” script subcommands, e.g., “parallel for ...”:
 - “nodename”, “noderank”, “nodecount”, “barrier”, “allgather”, “allreduce”, “for”
 - Available even in non-MPI builds, for single-node script compatibility
- Work scheduling:
 - Intra-node work scheduled via multithreading, CUDA, etc.
 - Inter-node distributed memory work scheduling of user analysis/viz scripts is provided by built-in load balancing implementation for VMD

Parallel MDFF Cross Correlation Analysis on Cray XK7

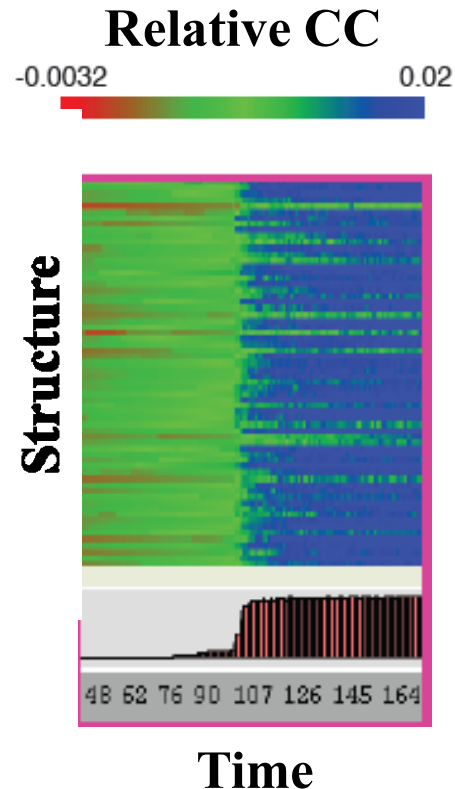

Rabbit Hemorrhagic Disease Virus (RHDV)

Traj. frames	10,000
Structure component selections	720
Single-node XK7 (projected)	336 hours (14 days)
128-node XK7	3.2 hours 105x speedup
2048-node XK7	19.5 minutes 1035x speedup

Calculation of 7M CCs would take **5 years** using serial CPU algorithm!

**RHDV colored
by relative CC**

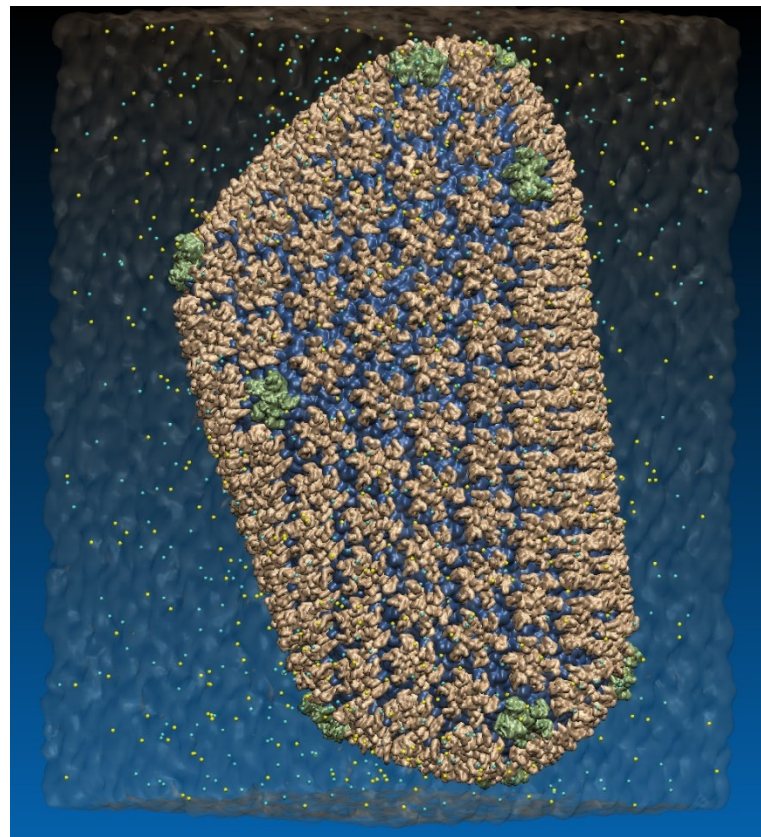

Stone et al., Faraday Discuss., 169:265-283, 2014.

VMD EGL Performance on Amazon EC2 Cloud

MPI Ranks	EC2 “G2.8xlarge” GPU Instances	HIV-1 movie rendering time (sec), (I/O %) 3840x2160 resolution
1	1	626s (10% I/O)
2	1	347s (19% I/O)
4	1	221s (31% I/O)
8	2	141s (46% I/O)
16	4	107s (64% I/O)
32	8	90s (76% I/O)

Performance at 32 nodes reaches ~48 FPS

High performance molecular visualization: In-situ and parallel rendering with EGL. J. E. Stone, P. Messmer, R. Sisneros, and K. Schulten. *2016 IEEE International Parallel and Distributed Processing Symposium Workshop (IPDPSW)*, pp. 1014-1023, 2016.

64M atom HIV-1 capsid simulation rendered via EGL

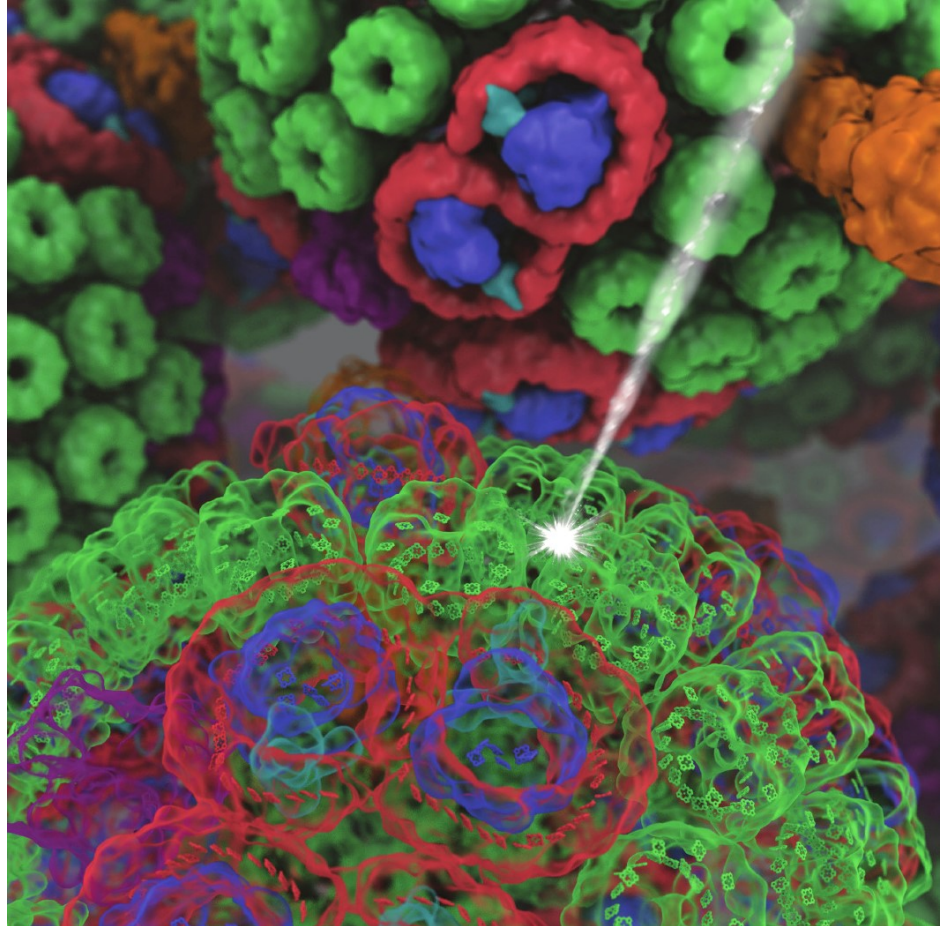

Trajectory I/O on Parallel Filesystems

- Don't use old/inefficient trajectory file formats if they can be avoided
- DO use file formats like DCD, NetCDF, JS, that permit efficient strided reads
- DO enable file striping for large trajectory files (more I/O parallelism)
- DO write simulation outputs to multiple files (more I/O parallelism)
- DO use VM page-aligned file formats that permit kernel-bypass direct-I/Os, and support for technologies like GPU-Direct Storage
- **VMD has read trajectories at up to 71GB/sec from JS files on DGX-2 dense multi-GPU nodes with GDS, w/ Weka I/O**

High Fidelity Ray Tracing for Interactive and Cinematic Visualization

High Fidelity Ray Tracing

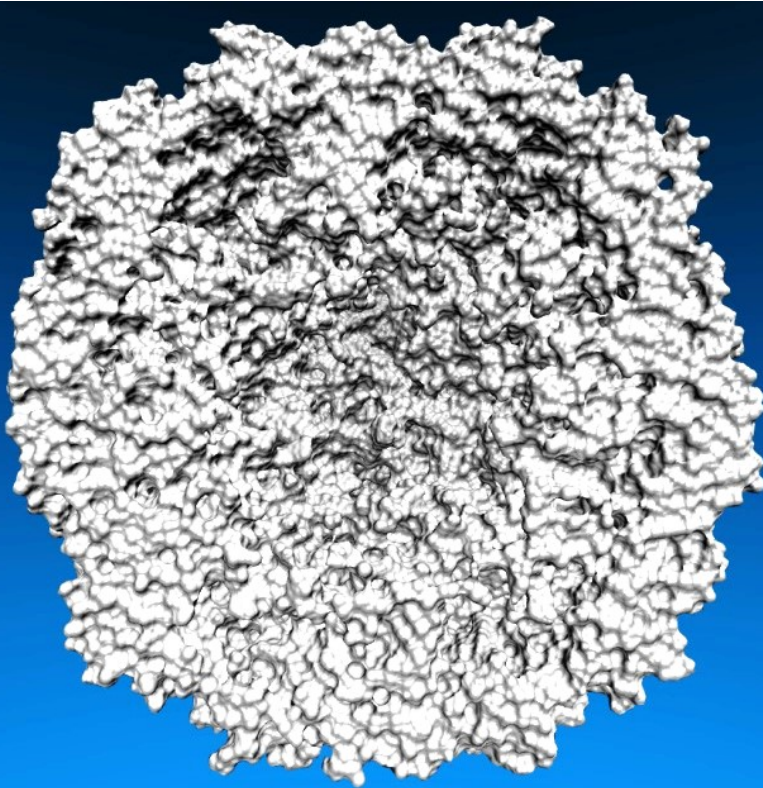

- Advanced rendering techniques save scientists time, produce images that are easier to interpret
- Ambient Occlusion, Depth of Field, high quality transparency, instancing,
- **Interactive RT** on laptops, desk, cloud, and **remote supercomputers**
- **Large-scale MPI parallel rendering:** in situ or post hoc visualization tasks
- Stereoscopic panorama and full-dome projections
- **Omnidirectional VR: YouTube, HMDs**
- Built-in ray tracing engines:
 - **Tachyon:** cross-platform RT
 - **NVIDIA OptiX:** GPU RTX-accelerated
 - **Intel OSPRay:** CPU x86-optimized

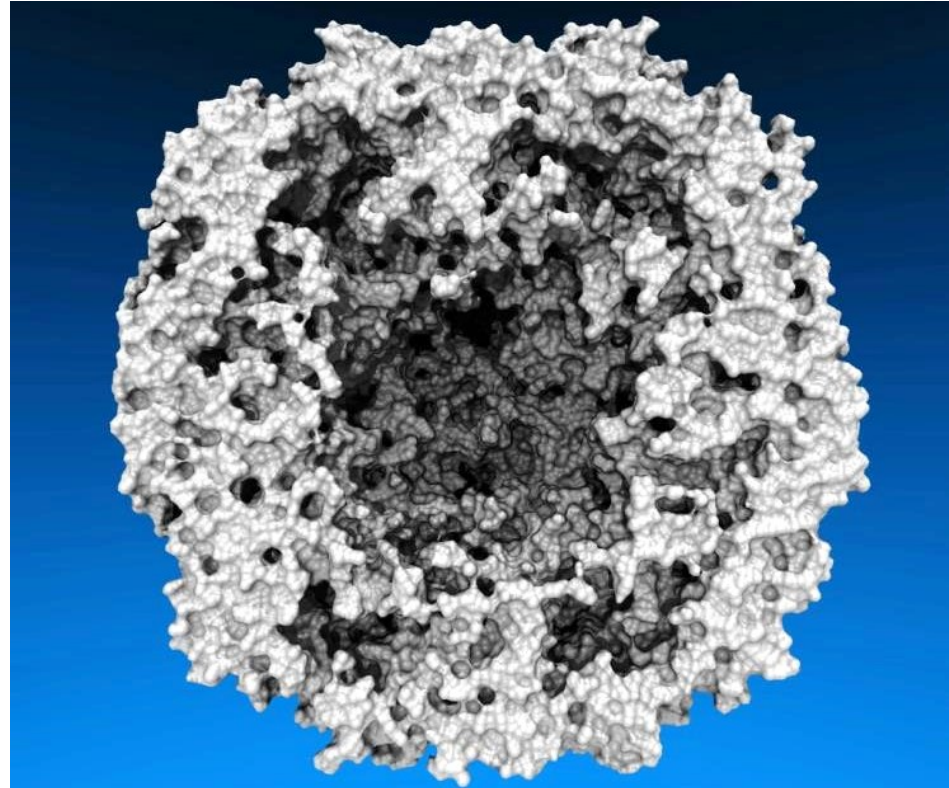

VMD/OptiX all-atom Chromatophore

Lighting Comparison, STMV Capsid

Two lights, no shadows

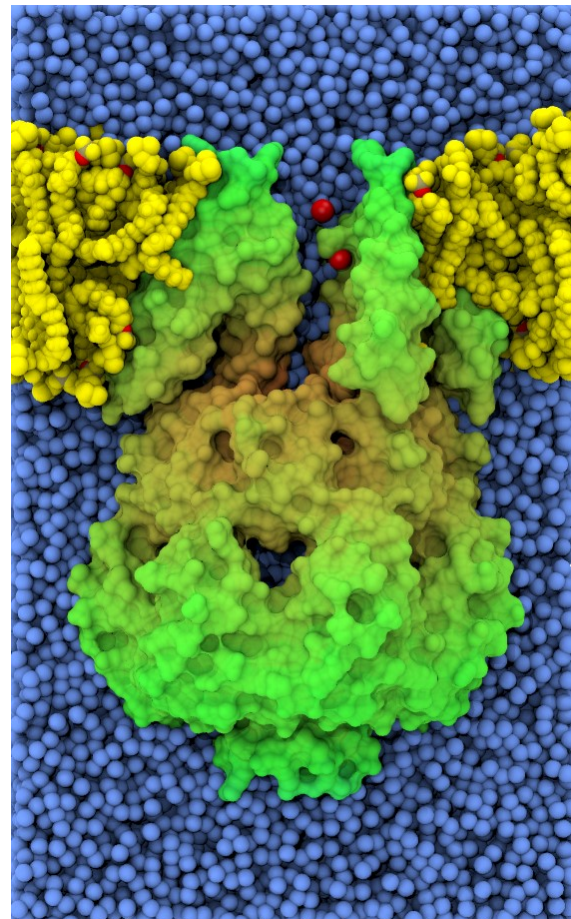

Ambient occlusion + two lights, 144 AO rays/hit

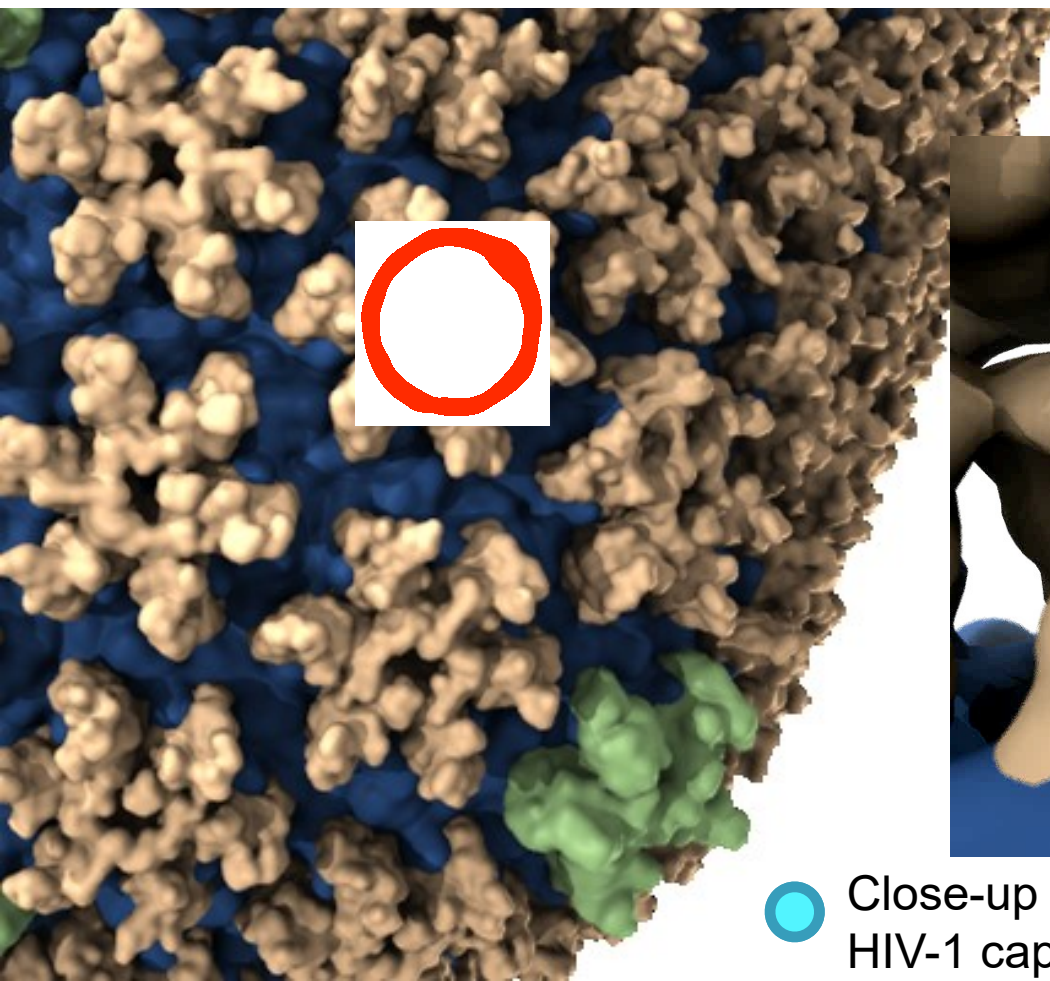

Geometrically Complex Scenes

Ray tracing techniques well matched to molecular viz. needs:

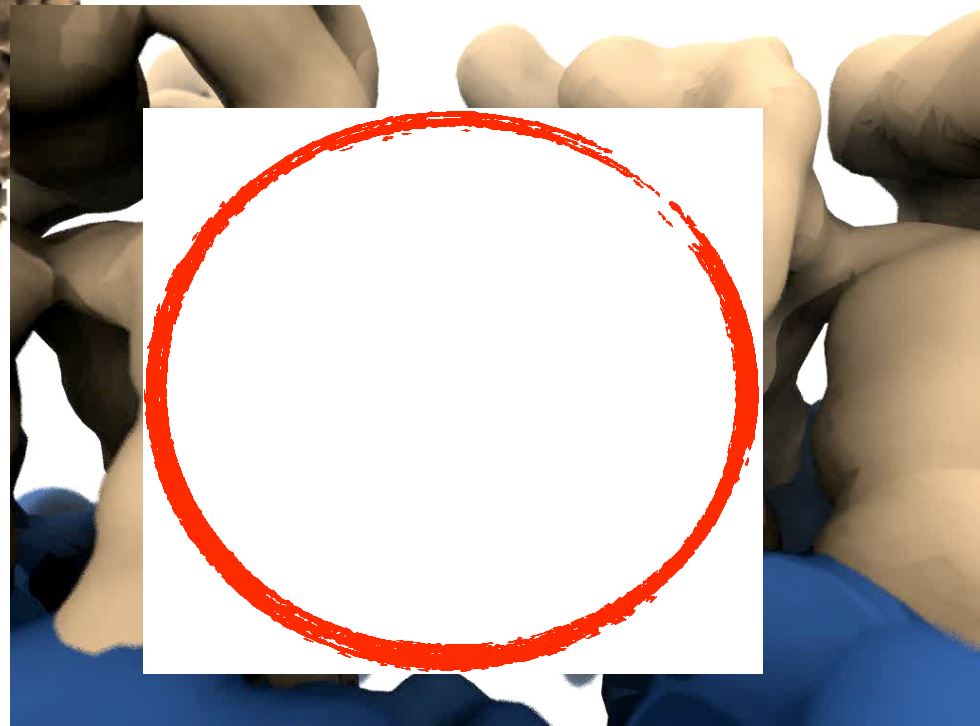

- Curved geometry, e.g. spheres, cylinders, toroidal patches, easily supported
- Greatly reduced memory footprint vs. polygonalization
- Runtime scales only moderately with increasing geometric complexity
- Occlusion culling is “free”, RT acceleration algorithms do this and much more

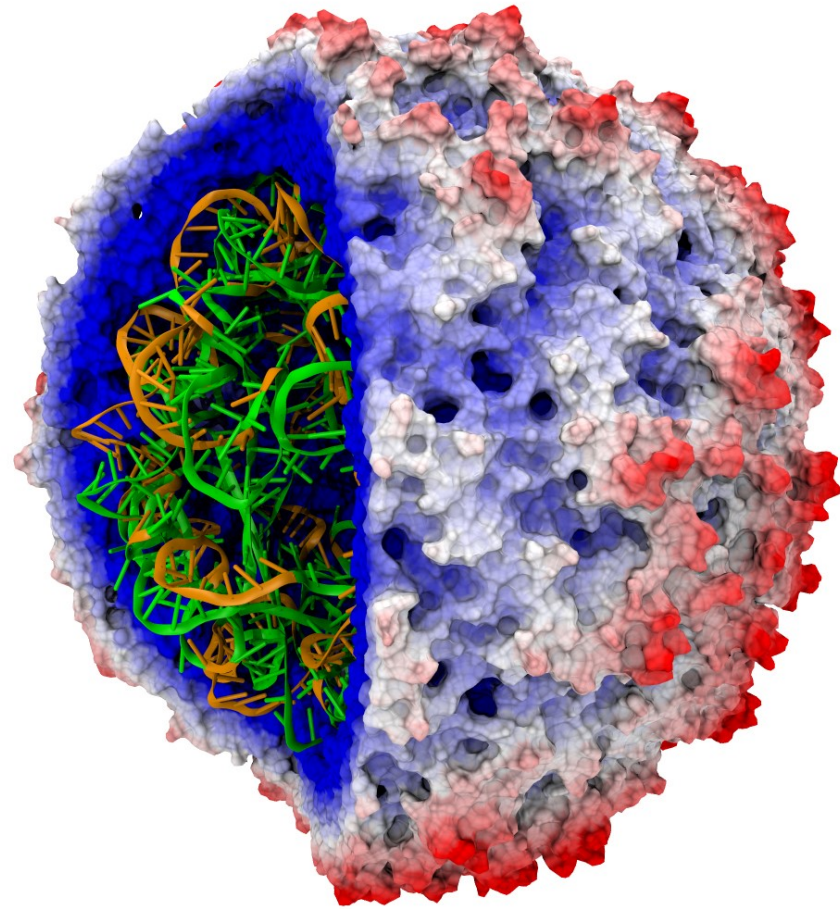

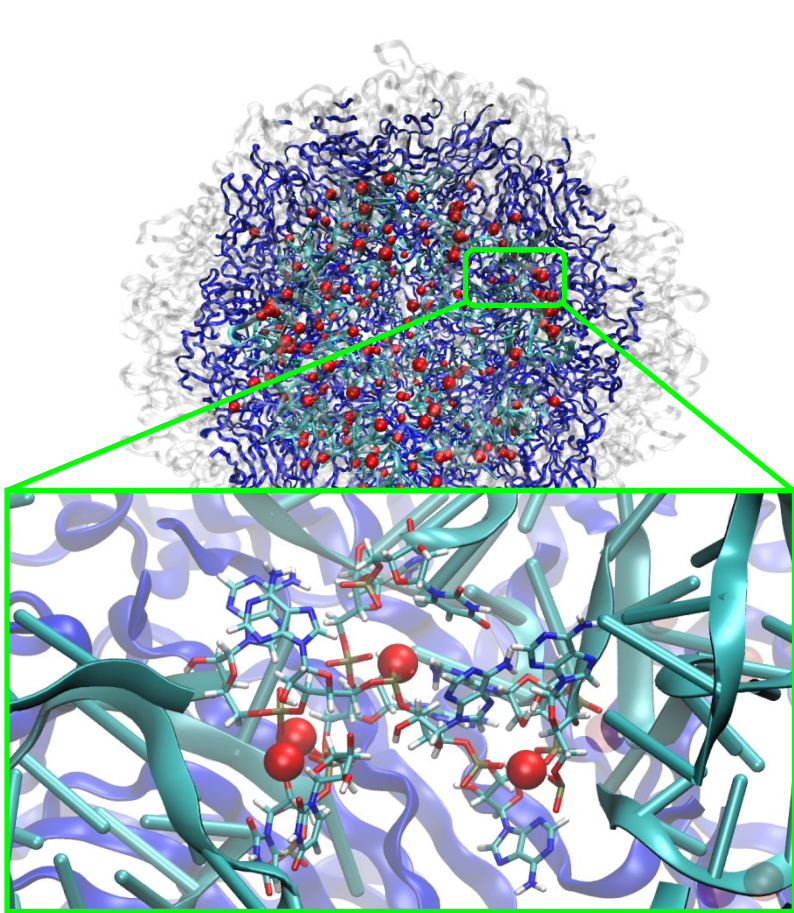

Goal: Intuitive interactive viz. in crowded molecular complexes

Results from 64 M atom, 1 μ s sim!

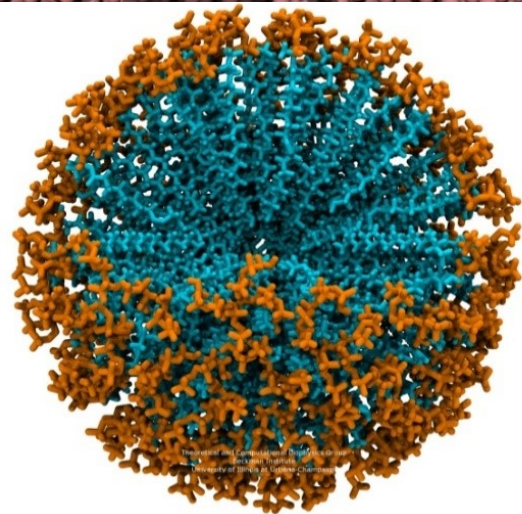

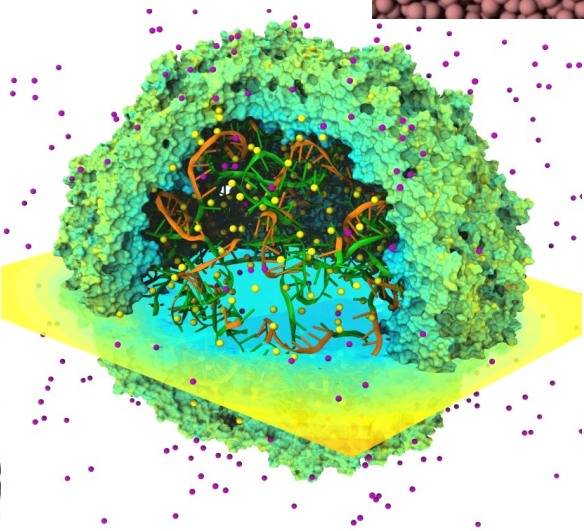

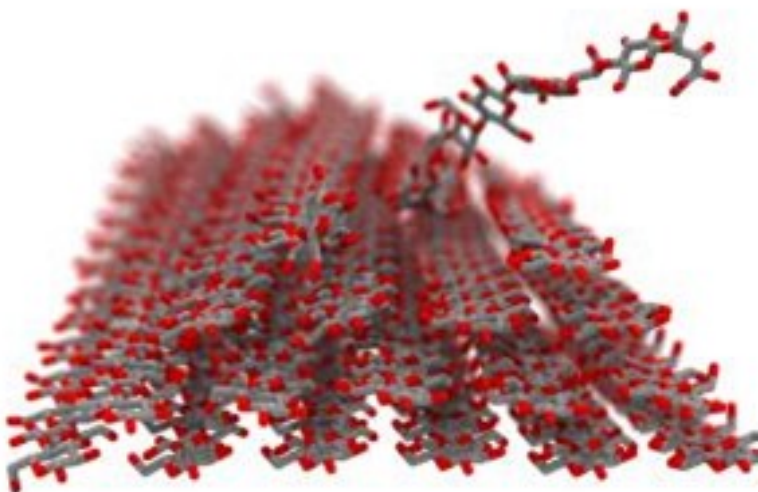

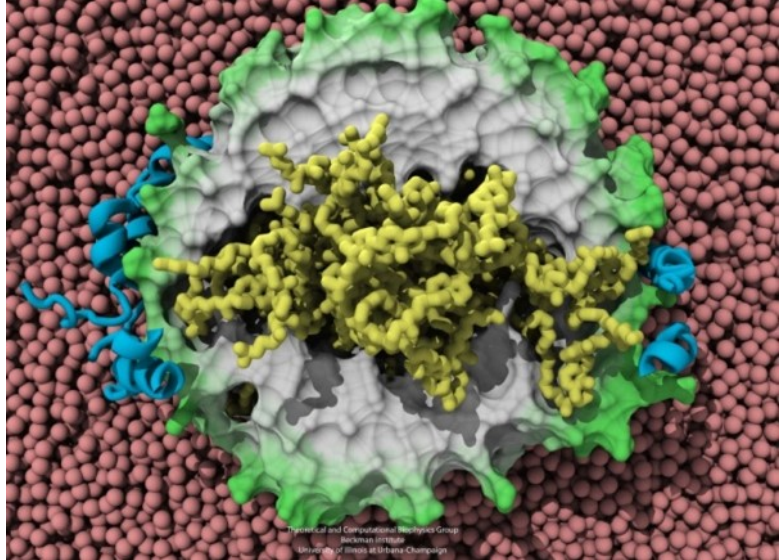

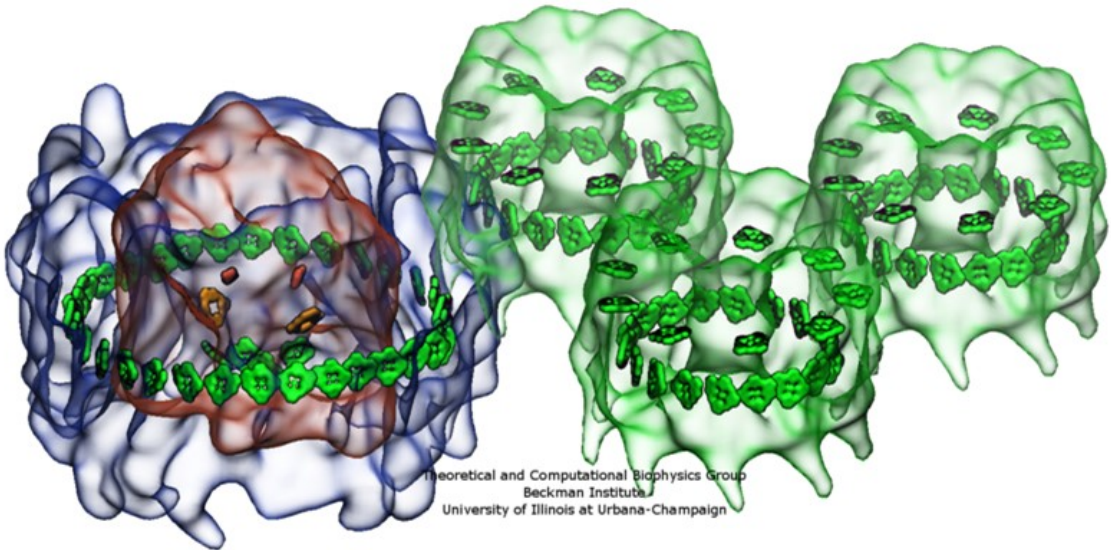

Close-up view of chloride ions permeating through HIV-1 capsid hexameric centers

“When I was a young man, my goal was to look with mathematical and computational means at the inside of cells, one atom at a time, to decipher how living systems work. That is what I strived for and I never deflected from this goal.” – Klaus Schulten
